MINI PROJECT NO 1:

TOPIC:

AI SYSTEM MAP

Product:

YouTube Shorts / TikTok Recommendation System

1. Data Collection:

We collect user data like clicks, likes, how long user watched the video, and video details.

2. Data Cleaning:

We clean the data. We remove duplicate views and fix wrong or missing data.

3. Features:

We select important features like user history and what type of videos user likes.

4. Model Training:

AI model learns from old data. It learns patterns like which user likes which type of video.

5. Checking / Testing:

We test if model is working correctly. We check accuracy and do A/B testing.

6. Launch:

After testing is ok, we deploy the model in the real app so all users can use it.

7. Feedback:

If user likes or skips the video, this feedback goes back to Stage 1.

So the system learns more and gives better videos next time.

Objective:

To show the best videos and keep the user watching longer.

Guardrails:

To block bad or unsafe videos and keep content fair.

KPIs: Watch Time and CTR (how many people click).
